Dear Colleague:

Re: Horbert Bernadet

We have examined Bernadet during the last few days and we have found the following findings:

Visual acuity (using picture cube) was RE 5.5/7.5, LE 1/7.5.

In the right eye, congested conjunctiva with papillary reaction but otherwise normal. In the left eye, the conjunctiva is congested with papillary reaction, and a scar is seen in the center of the cornea. Fundi are normal. Refraction shows: RE +2.00, LE: -0.50 -1.00 x 135 (the examination of the LE was very difficult).

Bernadet was examined also by Prof. Frucht-Pery, our cornea specialist, and our optometrist, and we all think that there is no place for corneal graft right now. We recommend that she will wear plano hard contact lens in her left eye, because of the irregular corneal surface, and to occlude the right eye as much as possible to overcome the amblyopia. There is a chance that the cornea will clear up over time.

If you would like to talk to us, please do not hesitate to call to telephone +972-2-6776365.

Sincerely yours,

Jacob Pe'er, M.D.
Chairman
Department of Ophthalmology
